

## Finding level ground

Intertech Commercial Flooring's San Antonio team with Mark Jones, a vice president and general manager of San Antonio, front and center

An innovation **Intertech Commercial Flooring** has adopted in the last two years was used on a project that recently earned the San Antonio branch national recognition.

**Mark Jones**, vice president of San Antonio operations and general manager of the San Antonio branch, says the company has teamed up with **Laticrete**. The manufacturer has a product, Supercap, and designed a pump truck for its application.

Intertech has done more work with this technology in the San Antonio market than any of its other locations. They have used it on various projects, including the University Health System Tower and the Tobin Center for the Performing Arts. The latter project was a silver award winner at the 17th annual Starnet Design Awards.

While this work in concrete leveling with Supercap has been positively impacting project costs and timelines to meet lean construction standards, Inter-

tech still does just about everything from wood flooring and ceramic tile to carpet and raised access flooring.

The San Antonio branch has 16 employees in the office and approximately 60 installers out in the field. They also strive to do everything in house. Recent jobs include a project for CPS and a Christus Santa Rosa Hospital. They are currently finishing the Frost Bank at Westover Hills, where they did 250,000sf of raised access flooring. The floor is six inches high so the electrical and data are run under it, and then Intertech put carpet tile on top of the raised access flooring.

Jones has been with Intertech since day one, helping start the company in Austin in 1988 with three other founders, including **Bill Imhoff**, who is the sole owner.

*Intertech Commercial Flooring does installation, maintenance and design consultation and provides commercial flooring products. -mh*
